

“One Pass Binding” Delivers Quality, Speed And Easy Operation

DigiUltrabind Automatic Perfect Binder

The DigiUltrabind offers one pass binding technology, which allows production cycles up to 250 times per hour (an average operator produces about 200 to 250 books per hour). Books are placed in the clamp on the left and pass through the chipper and glue and end at the right picking up the cover. The DigiUltrabind requires little adjustment, but the spine pressure can be adjusted for a square or round spine. The notching, adhesive application and nipper clamping are all automatic. The only thing the operator needs to do is place a cover into position. Another unique feature of the DigiUltrabind commonly found on more expensive binders is its dynamic nipper table which automatically senses and adjusts to the size of the book and has side gluing for stronger and lasting cover binding. Book cover hinge scoring (optional).
